

MAKING A DIFFERENCE ONE PATIENT AT A TIME

Dolphin[®] Fluid Immersion Simulation[®] Personally Impacts a Caregiver

As a nurse, Jan Greene, RN, WCC leveraged everything in her power to heal her patients' wounds. Yet despite her best efforts and those of her team, she had many patients whose skin continued to break down.

"The technology provided a better opportunity to help us give patients a better outcome." – JAN GREENE, RN, WCC

"I was frustrated with the progress we could offer our patients," Jan explained. "The lack of new, meaningful technologies limited my ability to significantly impact their wound care. I was seriously considering leaving the wound care area."

In a partnership with Joerns Healthcare, Jan's facility agreed to trial Dolphin[®] Fluid Immersion Simulation[®], and its results impacted both patients and Jan. "We were able to halt the process of skin breakdown, and start making progress in the right direction," she said. "The technology provided a better opportunity to help us give patients a better outcome."

"The Dolphin allowed us to position patients in an upright position which gave them a sense of normalcy. They could sit up when talking with their family and friends, and people need a way to change positions to be comfortable," she said. "The Dolphin gave us a lot more versatility."

Dolphin FIS not only impacted Jan's patients—it also impacted her personally. Before she trialed the Dolphin, she considered leaving wound care, because she was frustrated with her inability to help patients more. But Dolphin FIS restored her enthusiasm. "With the Dolphin FIS technology, I could see real improvement in the wound care of my patients for the first time in a long time," she said. "I love that bed; it's great! Dolphin really invigorated my passion for treating wounds."
